June 18, 2013

*The views and opinions expressed are my own and do not  
necessarily represent those of the U.S. Census Bureau*

# Census Bureau's Role

- The Census Bureau serves as the leading source of quality data about the nation's **people and economy**. (from the *U.S. Census Bureau Mission Statement*)
  - Not health-focused
  - Does not *do* public health surveillance
- Does collect some disability information
  - Survey of Income and Program Participation (SIPP)
  - American Community Survey (ACS)

# Conceptual Framework (Nagi model)

# Survey Questions on Vision Difficulty

- Survey of Income and Program Participation (SIPP)

“Does ... have difficulty seeing the words and letters in ordinary newspaper print even when wearing glasses or contact lenses if ... usually wear them?”

Yes  No  Person is blind

“Is ... able to see the words and letters in ordinary newspaper print at all?”

Yes  No

# Survey Questions on Vision Difficulty

- American Community Survey (ACS)
  - “Is ... blind or does ... have serious difficulty seeing even when wearing glasses?”
  - Yes
  - No

Issued July 2012

P70-131

#### INTRODUCTION

The population of people with disabilities inhabit a distinct position in the U.S. economy, both for their contributions to the marketplace and roles in government policies and programs. People with disabilities bring unique sets of skills to the workplace, enhancing the strength and diversity of the U.S. labor market.<sup>1</sup> In addition, they make up a significant market of consumers, representing more than \$200 billion in discretionary spending and spurring technological innovation and entrepreneurship.<sup>2</sup> People with disabilities also often rely on various government interventions to maintain their participation in the community. Federal programs like Social Security and Medicare and more than 60 smaller federal and state programs provide a wide array of income, health care, and other support services to individuals with disabilities across the United States. In 2008, the federal government spent an estimated \$357 billion dollars on programs for working-age people with disabilities, representing 1.2 percent of total federal outlays.<sup>3</sup> While there is little doubt about the large economic impact of people with disabilities, estimates of the size and characteristics of this population depend much on the definitions used to classify what it means to be disabled.

Because health professionals, advocates, and other individuals use the same term in different contexts, disability does not often refer to a single definition. Medical models view disability as an extension of a physiological condition requiring treatment or therapy. In contrast, social

models view disability as the result of societal forces on impairment, and suggest that changes to social norms and practices would reduce restrictions.<sup>4</sup> As a demographic category, disability is an attribute with which individuals may broadly identify, similar to race or gender. In contrast, certain federal programs narrowly define disability as the impairment or limitation that leads to the need for the program's benefit—such as the Social Security Disability Insurance program's income support for individuals who are not able "to engage in any substantial gainful activity."<sup>5</sup> The agencies and organizations that provide benefits to, advocate for, or study these populations, each refer to their targeted group as people with disabilities; but because of the differences in definitions, an individual may be considered to have a disability under one set of criteria but not by another.

The *International Classification of Functioning, Disability, and Health (ICF)* attempts to bridge many of these definitions by considering disability as an umbrella term for impairments, activity limitations, and participation restrictions.<sup>6</sup> Rather than a dichotomous concept, disability is a gradient on which every person functions at different levels due to personal and environmental factors. While the ICF provides a common language for discussion of the concepts associated with disability, operationalizing this framework for survey questionnaires is not a simple task. Surveys must contain questions about a finite set of activities and set thresholds for demarcating levels of functioning. While the U.S. Census Bureau is always looking towards ways to improve on how it measures topics like disability, having a consistent definition allows for comparisons of the

## Disability

The Census Bureau collects data on disability primarily through the American Community Survey (ACS) and the Survey of Income and Program Participation (SIPP). The definitions of disability are not always alike so caution should be taken when making comparisons across surveys. Generally, the SIPP estimates of disability prevalence are broader and encompass a greater number of activities on which disability status is assessed. The ACS has a more narrow definition but is capable of producing estimates for states, counties, and metropolitan areas. Because the ACS has replaced the decennial long-form as the source for small area statistics, there is no disability data in the 2010 Census.

In addition to these recent data sources, the Census Bureau has also produced disability estimates from the 2000 Census, and the Current Population Survey Annual Social and Economic Supplement (CPS ASEC). Other Federal agencies also collect and report disability statistics. Depending on your needs, one survey may be more suitable than another.
