Prevent Blindness; W.K. Kellogg Foundation

University of Michigan Center for Eye Care Policy and Innovation

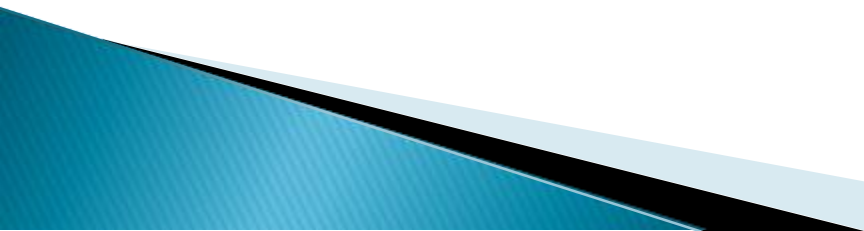

▶ Kellogg Eye Center

- Key Faculty: Joshua D. Stein, MD, MS; Paul P. Lee, MD, JD; David Musch, PhD, MPH
- Biostatisticians: Chris Andrews, PhD; Taylor Blachley, MS; Nidhi Talwar, MA; Leslie Niziol, MS

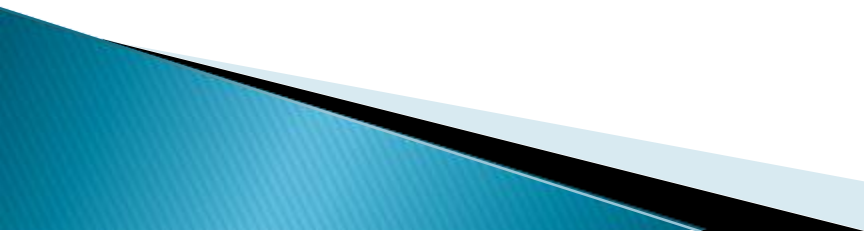

▶ University of Michigan School of Natural Resources

- Rebecca Anthopolos MS; Pam Maxson Ph.D; Marie Lynn Miranda Ph.D; Joshua Tootoo MS; Ellis Valentiner MS

Optum Clinformatics DataMart Database

- ▶ 18 million children (age 0–21)
 - ▶ Large nationwide managed care network
 - ▶ Longitudinal follow-up: 2001–2012
 - ▶ All diagnoses (ICD-9-CM billing codes) and all diagnostic and therapeutic procedures (CPT-4 billing codes)
 - ▶ Info on SES factors: age, sex, race, net worth
 - ▶ Info on all outpatient pharmacy records, lab test results
 - ▶ Info on type of health care provider evaluating patient, place of care
 - ▶ Info on all charges, standardized prices
- 

Medicaid MAX Database

- ▶ 50 million children (age 0–21)
 - ▶ Nationwide database of all persons in Medicaid in all 50 US states
 - ▶ Longitudinal follow-up: 2005–2010
 - ▶ All diagnoses (ICD-9-CM billing codes) and all diagnostic and therapeutic procedures (CPT-4 billing codes)
 - ▶ Info on SES factors: age, sex, race
 - ▶ Info on all outpatient pharmacy records
 - ▶ Some info on type of health care provider evaluating patient
 - ▶ Info on costs
- 

The Impact of Gestational Age and Birth Weight on the Risk of Strabismus among Premature Infants

- ▶ Shilpa Gulati, MS
 - ▶ Chris A. Andrews, PhD

Background

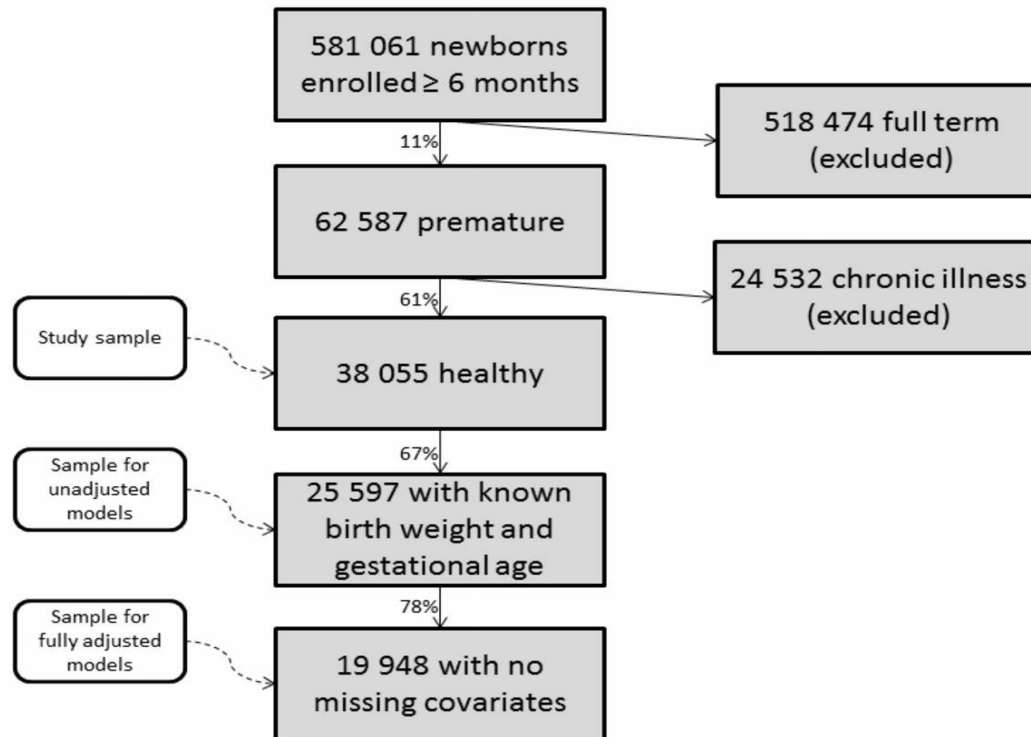

Fig. 1 Large-angle infantile-onset esotropia.

- Strabismus is a common childhood ocular condition estimated to affect 2–4% of children between the ages 6 months and 5 years
- Intervening early to correct strabismus results in improved BCVA, a reduced need for later surgical interventions, and reduced societal cost
- Well-recognized risk factors for strabismus include differences in the glasses prescription between the 2 eyes, genetics, older age of parents, maternal cigarette smoking during pregnancy, low APGAR score, craniofacial and chromosomal abnormalities, in utero toxin exposure, ROP and caesarian delivery
- It is unclear whether low birth weight (BW) and low gestational age (GA) are risk factors for strabismus

Methods

- ▶ **Data Source:** Clinformatics Data Mart Database
- ▶ **Inclusion / Exclusion Criteria:**
 - Included those continuously enrolled in the medical plan ≥ 6 months from birth
- ▶ **Definitions of Key Predictors – GA and BW:**
 - Infants with GA ≤ 32 weeks were defined as “very premature”; others with GA > 32 weeks were defined as “mildly premature”
 - Infants with BW < 2000 g were defined as “very low BW”; others with BW ≥ 2000 g at birth were considered “mildly low BW”
- ▶ **Outcome of interest:**
 - Diagnosis of strabismus was captured using ICD–9–CM code 378.xx; we required a confirmatory diagnosis submitted on a separate date to reduce error caused by miscoding

Sample Selection

Results

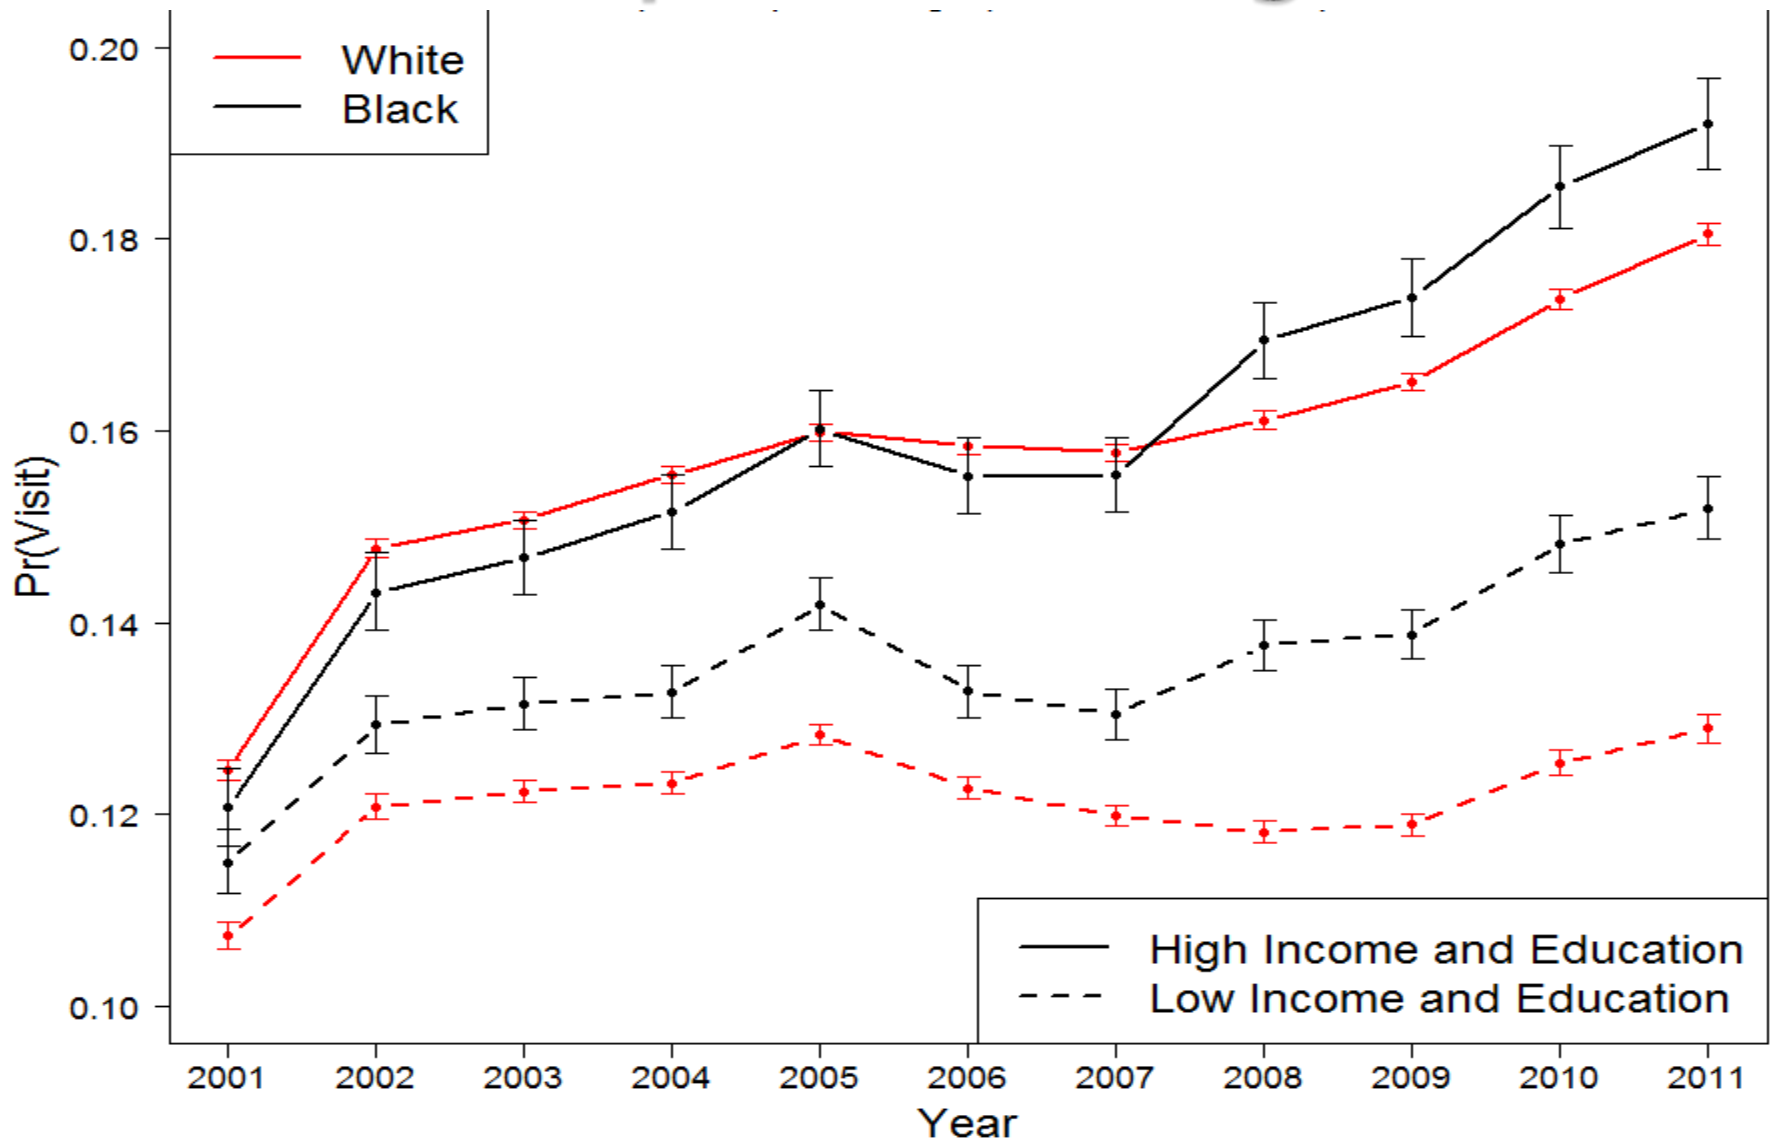

Key Findings

- For premature babies, BW appears to impact the risk of strabismus much more than GA
- Premature infants who weighed $<2000\text{g}$ at birth were found to have a 61% increased hazard of strabismus (relative to $\geq 2000\text{g}$), independent of GA and other factors
- After accounting for BW and other variables, premature infants born earlier than 32 weeks had no significantly different risk of strabismus (relative to >32 weeks)
- Currently, neither AAO or AAP guidelines recommend that clinicians monitor premature infants of low BW for strabismus and amblyopia beyond the standard ROP monitoring in the first 10 weeks of life^{7,11}
- Based on these study findings, existing guidelines should be reassessed for the inclusion of low BW as a key risk factor for developing strabismus requiring periodic evaluation

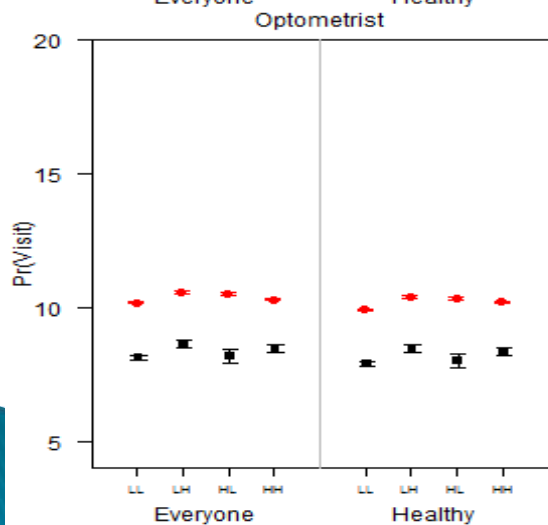

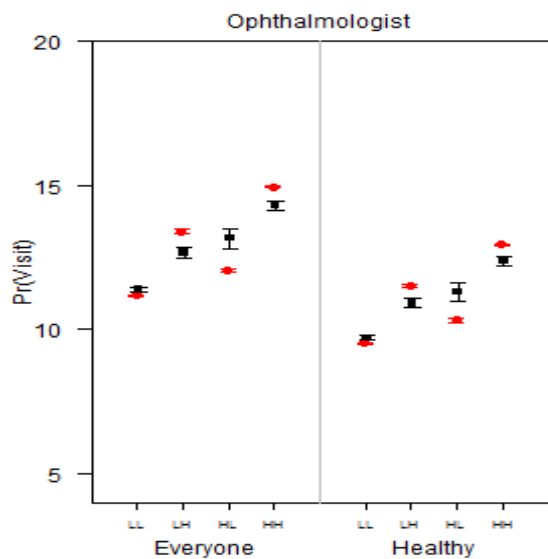

Visits to Ophthalmologists

Visits to Optometrists

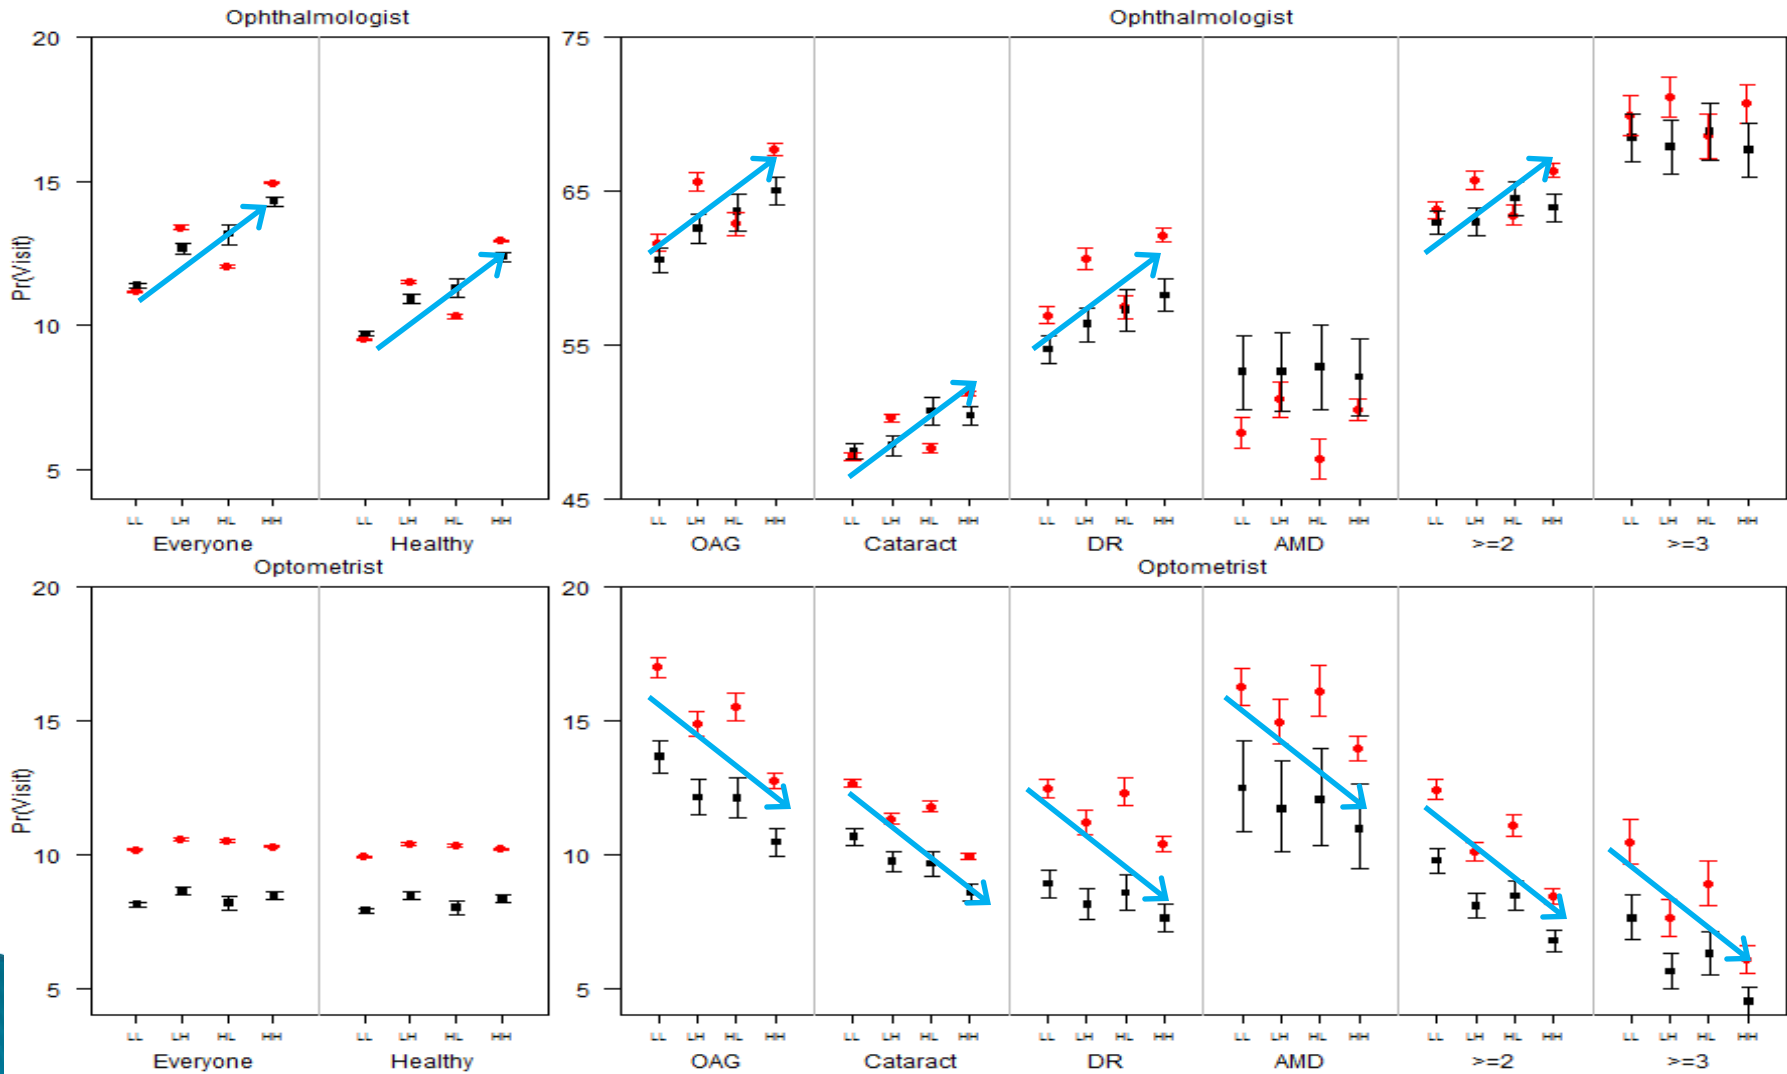

Likelihood of Visits to Ophthalmologists versus Optometrists

LL = Low income / Low education, LH = Low income / High education, HL = High income / Low education, HH = High income / High education

Likelihood of Visit Based on Ocular Diagnosis

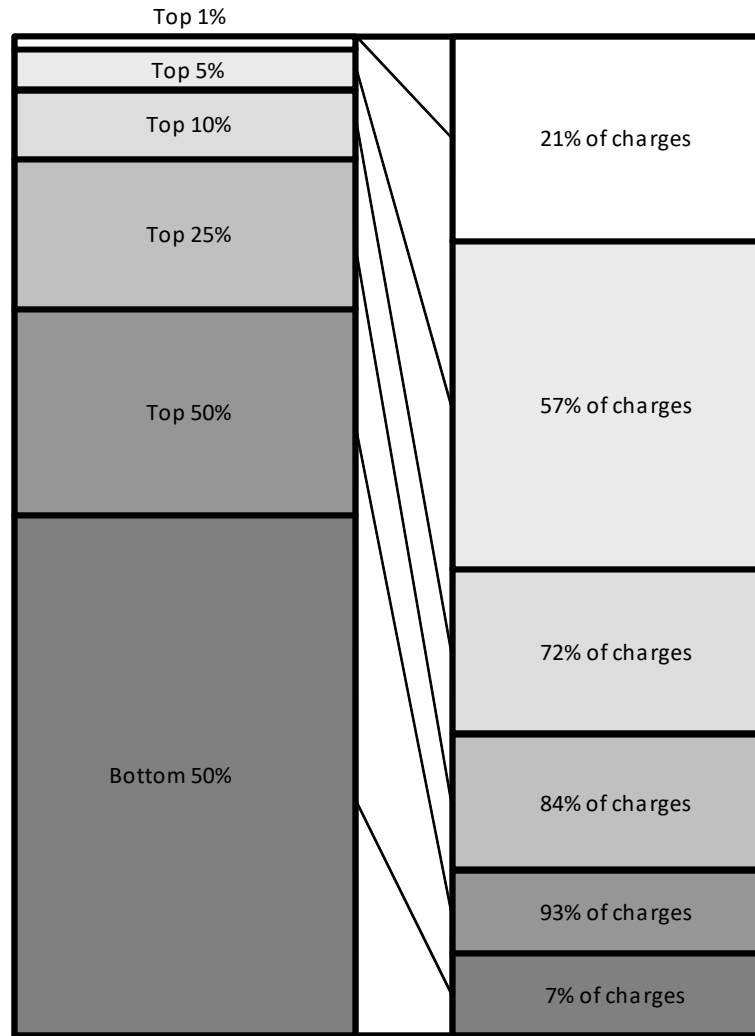

LL = Low income / Low education, LH = Low income / High education, HL = High income / Low education, HH = High income / High education

Key Findings

- ▶ Despite possession of health insurance, the likelihood of seeking eye care is influenced by:
 - Race
 - Income
 - Education
- ▶ Disparities are growing
- ▶ Probability of a visit to **ophthalmologists** more influenced by **affluence**
- ▶ Probability of a visit to **optometrists** more influenced by **race**
 - In comparison to blacks, whites have a higher probability of visits irrespective of eye condition and income/education
- ▶ Need to address disparities among both
 - Racial minorities and
 - Socioeconomically disadvantaged patients

Costliest Eye Care Recipients

Strabismus and Net Worth

Incidence of Strabismus at Age 3 Among Children in Medicaid

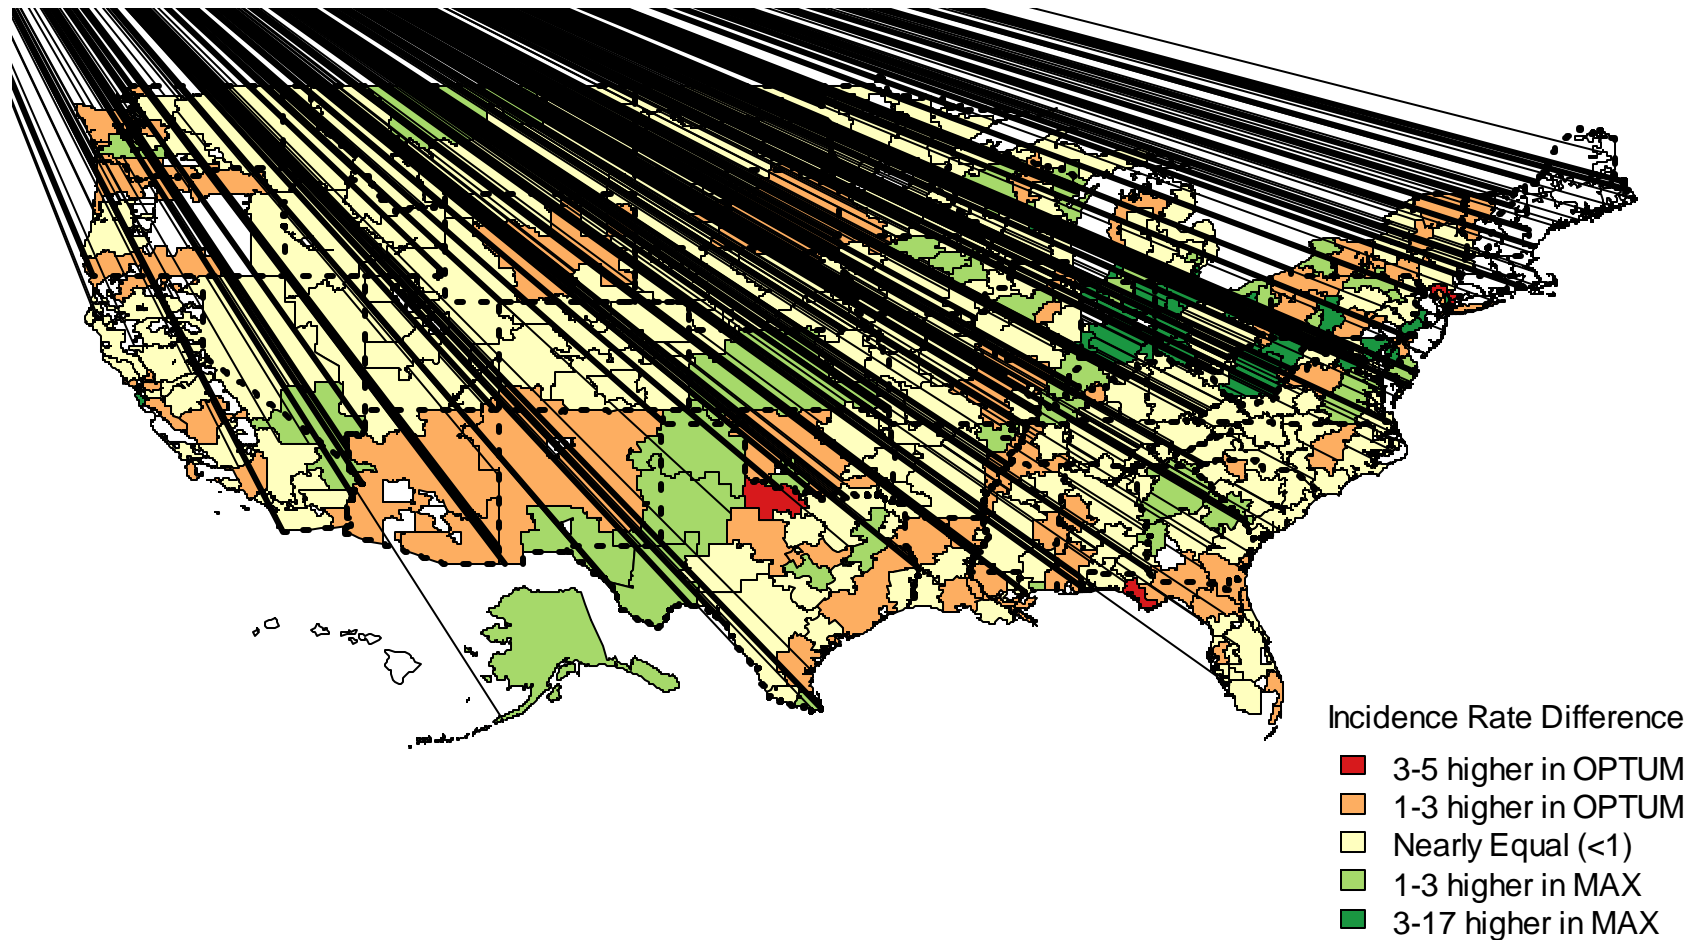

Incidence of Strabismus at Age 3 Among Children in Optum

Incidence of Strabismus at Age 3

Difference between MAX and OPTUM

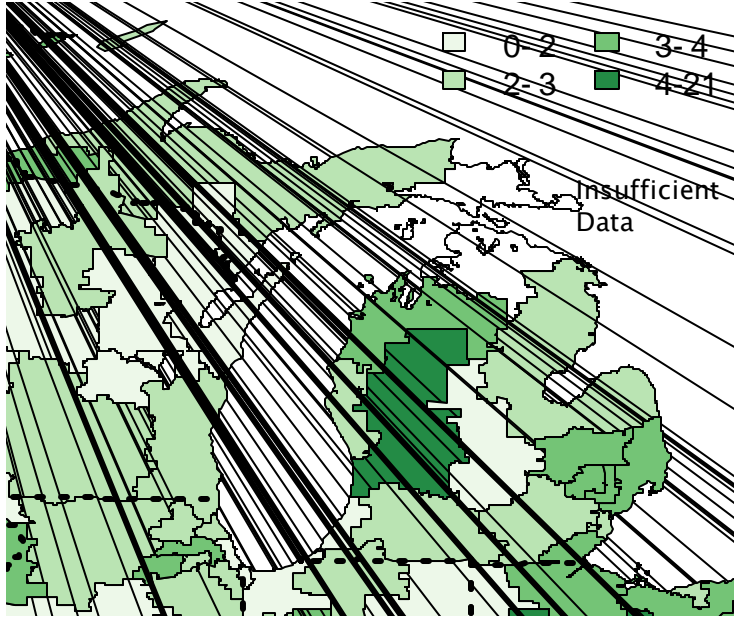

Difference (MAX - OPTUM)

Strabismus Incidence at Age 3

Medicaid MAX

Strabismus Incidence at Age 3

OPTUM

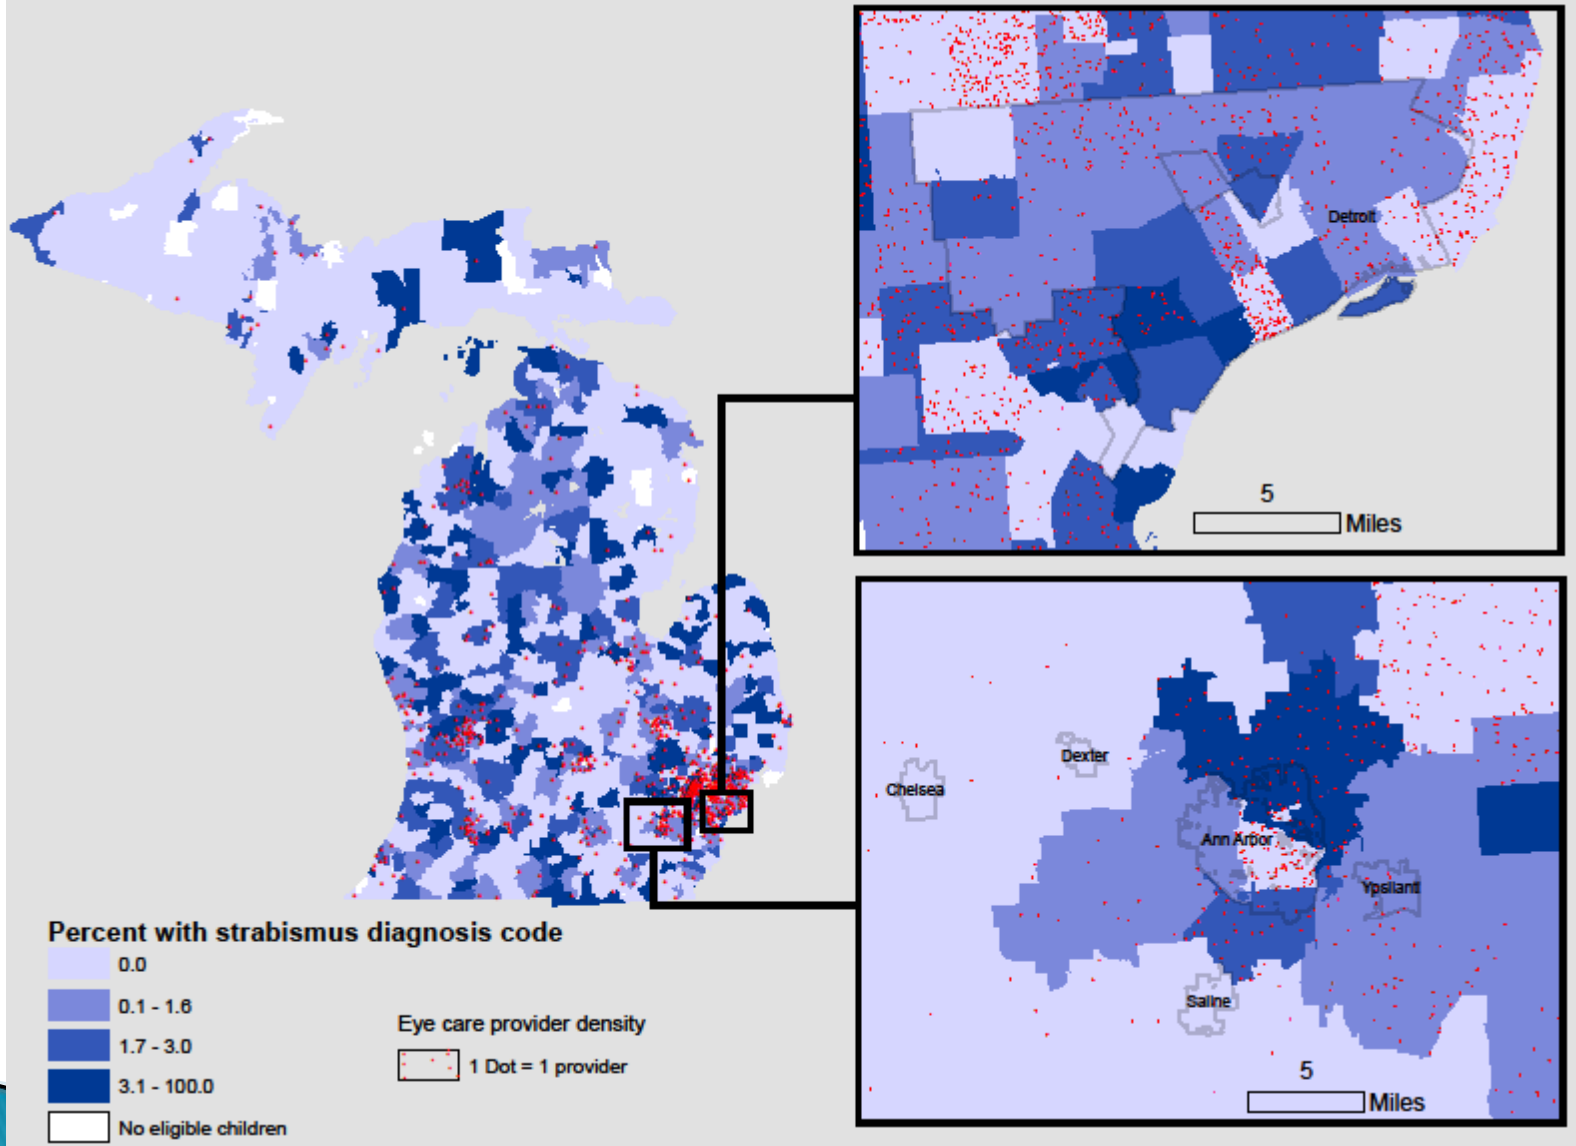

Strabismus in MAX and OPTUM at HRR level

- ▶ Weak correlation between strabismus incidence in two datasets. ($r=0.21$)
- ▶ Even weaker in MI ($r=0.12$)
- ▶ 4 (of 15) MI HRRs are below average in both datasets:
 - Lansing
 - Marquette
 - Muskegon
 - Saginaw

Incidence of Strabismus and Amblyopia by ZCTA

Percent of eligible children with a strabismus diagnosis code ZCTA level 2009

- Population weighted ZCTA centroid not within a 30 minute drive time
- Population weighted ZCTA centroid within a 30 minute drive time

231,495/9,883,638 or 2.3 % of Michigan's total population is more than a 30 minute drive from either an ophthalmologist, or an optometrist

Conclusion

- ▶ Large databases can be very useful:
 - Epidemiology of diseases
 - Utilization patterns of diagnostic and therapeutic procedures
 - Outcomes of care
 - Risk Factors
 - Costs of care
 - Disparities / inequities in care
 - ▶ When working with these datasets, important to understand the capabilities and limitations of these sources
-
